

Managing Projects in GitHub

MPG | 1 Day

Plan, track, and manage your team's work in one place with GitHub Projects. This one-day course is designed to help teams and individuals turn GitHub into a working agile planning tool, from organizing a product backlog to running a sprint. Through hands-on labs built around a shared case study, you'll learn practical, proven ways to visualize work, manage flow, and deliver as a team.

Who should take this class?

This course is for anyone on a software development team, especially those who create and refine a product backlog or plan and execute work within a sprint. It's equally valuable for people outside the development team, including managers, Scrum Masters, coaches, and other stakeholders, who want hands-on exposure to what GitHub Projects can do.

Some project management and software development experience, as a team member or a manager, is recommended. Experience with agile development, Scrum, and GitHub is helpful but not required. Attendees should read and be familiar with the [Scrum Guide](#) prior to class.

Course content

This course progressively builds your fluency with GitHub Projects, from setting up your organization and backlog to planning and managing a sprint. You'll work hands-on in teams on a common case study using a shared GitHub instance, putting each capability to use the way a real agile team would.

1. INTRODUCTION TO GITHUB PROJECTS

- GitHub Projects overview
- Organizations and enterprises
- Teams (visibility and nested teams)
- Creating and configuring a project
- User projects
- Project templates
- Sharing project updates
- Hands-on lab

2. THE PRODUCT BACKLOG

- Product Backlog overview
- Creating items and converting them to issues
- Project views: table, board, and roadmap
- Customizing view layout
- Filtering, grouping, slicing, and ordering
- Creating and using custom fields
- Creating charts using Insights
- Archiving items
- Hands-on lab

3. PLANNING AND MANAGING A SPRINT

- Sprint Planning overview
- Setting up the sprint and configuring iterations
- Velocity, throughput, and capacity
- Planning a sprint and the Sprint Backlog
- Visualizing work using the board view
- Work in Progress (WIP) and limiting WIP
- Collaborating as a team: pairing, swarming, and mobbing
- Definition of Done
- Tracking sprint progress
- Duplicating views, copying projects, and creating templates
- Completing a sprint
- Hands-on lab

Course Designer

This course was designed by Richard Hundhausen, a Professional Scrum Trainer, co-creator of the Nexus framework, and a longtime developer who helps teams plan and deliver software using Scrum, agile practices, and GitHub. To see other DevOps and agile courses, visit www.accentient.com.
